SHUBHAM SHINDE

Full-Stack Developer | Portfolio RAG Knowledge Base

Purpose
A structured, retrieval-friendly knowledge source for the portfolio chatbot. This updated edition includes fuller descriptions of each known portfolio project, its features, technical implementation, and relevant search terms.

Contact and profile

Role	Full-Stack Developer
Email	shubham.a.shinde09@gmail.com
Phone	+91-7030750901
Links	The resume lists LinkedIn, GitHub, portfolio, and project links, but the actual URLs are not available in the extracted resume text used for this document.

How the chatbot should use this file

Answer questions using the information below. Keep responses relevant to the visitor's question. Do not invent missing URLs, deployment details, user counts, performance benchmarks, project dates, or technologies. If a fact is not covered, say that it is not specified in the available portfolio knowledge base.

1. Professional Summary

Shubham Shinde is a Full-Stack Developer with 1+ year of professional experience building web applications with React.js, Node.js, Express.js, MongoDB, REST APIs, and AWS. His resume lists freelance work for TruQual and ADSD Engineering from October 2025 to Present, following a Full-Stack Developer role at Dentavibe from February 2025 to October 2025. His project work includes real-time chat systems, AI-powered career tools, a movie-booking platform, and a RAG-based customer-support chatbot. He received appreciation from OpenAI's Head of Engineering for identifying a UI bug.

2. Technical Skills

Category	Skills
Languages	JavaScript, TypeScript, HTML5, CSS3, SQL, Java
Frontend	React.js, Redux, Tailwind CSS, SCSS, Bootstrap, responsive UI, Vite, code-splitting, lazy loading
Backend	Node.js, Express.js, REST APIs, JWT authentication, role-based access control (RBAC)
Data and messaging	MongoDB, Redis, Pinecone, RabbitMQ, Socket.IO
Cloud and tools	AWS, Vercel, Render, Firebase, Hostinger, Git, GitHub, CI/CD, Postman, Docker
AI and integrations	Gemini AI, text embeddings, RAG, AI agents, Zoho CRM, ImageKit, Nodemailer, Cloudinary, Razorpay, Stripe, TMDB API, Inngest

3. Project Descriptions

Use each project heading and its associated keywords as a retrieval unit. The descriptions below combine the supplied resume with project details previously provided for the portfolio. Treat any unlisted metric or URL as unknown.

3.1 Real-Time Chat App with Microservice Architecture

Overview: A distributed real-time messaging application designed around separate Node.js and TypeScript microservices for user, chat, and mail functionality. It uses asynchronous messaging and caching to support authentication workflows and responsive chat interactions.

- Architecture: User, Chat, and Mail microservices hosted on AWS EC2.
- Messaging and data: RabbitMQ handles asynchronous OTP processing; Redis stores OTPs and supports rate limiting.
- Real-time features: Socket.IO supports messaging, typing indicators, read receipts, online presence, and unseen-message counts.
- Authentication and services: OTP-based JWT authentication, Axios-based inter-service HTTP communication, and Cloudinary image uploads through Multer.
- Frontend: React interface with a mobile-responsive chat experience.

Search keywords: Node.js, TypeScript, microservices, AWS EC2, RabbitMQ, Redis, Socket.IO, OTP, JWT, rate limiting, real-time messaging, typing indicators, read receipts, Cloudinary, Axios.

3.2 InterviewIQ.ai — AI-Powered Mock Interview Platform

Overview: An AI-powered mock-interview platform intended to simulate an interview session for a selected role. The platform guides a candidate through timed questions, captures spoken responses, and uses AI-driven follow-up questions to make the interview experience more interactive.

- Supports role-specific interview sessions and role-based difficulty adjustment.
- Includes voice-based answers and smart follow-up questions.
- Uses a timer-based interview simulation.
- Includes Razorpay payment integration.
- The broader user flow previously described includes Google sign-in, resume upload and extraction, a live voice interview with an avatar, and a feedback/performance report. Availability of each feature should be verified against the current live deployment.

Search keywords: InterviewIQ, AI mock interview, voice interview, AI avatar, resume upload, resume extraction, role-based difficulty, follow-up questions, interview timer, feedback report, Razorpay.

3.3 SparkCv.ai / AI Resume Builder

Overview: An AI-powered resume-building application that helps users create ATS-oriented resumes. It supports AI-assisted writing for resume summaries and experience descriptions, and can parse an uploaded resume to help transform it into a more structured, ATS-ready version.

- Generates or improves resume summaries and experience content with AI assistance.
- Supports resume parsing from an uploaded file.
- Focuses on ATS-friendly resume structure and keyword alignment.
- The resume lists a 90%+ keyword match rate for the AI Resume Builder; this is a reported project metric, not an independently verified benchmark.
- Technology stack recorded for SparkCv.ai: React, Node.js, Express, MongoDB, JWT authentication, Redux, JavaScript (ES6+), HTML5, and CSS3.

Search keywords: SparkCv.ai, AI resume builder, ATS resume, resume parsing, AI-generated summary, experience writing, keyword match, React, Node.js, Express, MongoDB, JWT, Redux.

3.4 CineBook — Movie Booking Platform

Overview: A MERN-stack movie-booking application that supports user authentication, seat selection, and payment processing. It integrates movie information through TMDB and uses background jobs to support asynchronous workflows.

- Uses Clerk for authentication and role-based access control.
- Integrates Stripe payments with webhook handling.
- Provides real-time seat selection for the booking flow.
- Uses Inngest for background jobs and TMDB API for movie data.
- MERN stack: MongoDB, Express.js, React, and Node.js.

Search keywords: CineBook, movie booking, MERN, Clerk, RBAC, Stripe, webhooks, seat selection, Inngest, TMDB API, MongoDB, Express, React, Node.js.

3.5 RAG-Powered Customer Support Chatbot

Overview: A retrieval-augmented generation (RAG) chatbot designed to answer customer-support questions using information stored in a knowledge base. The system retrieves semantically relevant document chunks from Pinecone and uses Gemini AI to generate a response grounded in the retrieved context.

- Backend: Node.js and Express.js.
- Generation model: Gemini AI (the project notes identify gemini-1.5-flash for response generation).
- Embeddings: Google text-embedding-004 is recorded in the project notes; the ingestion pipeline was configured to produce 1024-dimensional embeddings in the observed run. Confirm that the configured model and index dimension remain aligned before re-ingestion.
- Vector search: Pinecone stores document embeddings and supports similarity retrieval.
- Ingestion workflow: load PDF/text documents, split them into chunks, generate embeddings, and upsert vectors into the Pinecone index.
- Frontend: Vanilla HTML, CSS, and JavaScript. Deployment notes identify Render.
- Primary use case: retrieve relevant support-policy or knowledge-base information and use it as context for generated answers.

Search keywords: RAG, retrieval-augmented generation, customer support chatbot, Gemini AI, text embeddings, text-embedding-004, Pinecone, vector database, semantic search, chunking, document ingestion, Node.js, Express.js, Vanilla JavaScript, Render.

4. Professional Experience

Freelance Full-Stack Developer — TruQual & ADSD Engineering

Dates: October 2025 – Present | **Work arrangement:** Remote

- Built a responsive React application for TruQual with a role-protected admin dashboard, using Vite, code-splitting, lazy loading, and component-based architecture.
- Developed a Node.js, Express.js, and MongoDB backend with Firebase JWT, RBAC, and protected REST APIs.
- Implemented CRUD workflows, event and candidate status tracking, newsletter management, and media/email integrations using Multer, ImageKit, and Nodemailer.
- Works directly with multiple clients to develop, maintain, and deliver production-ready full-stack solutions.

Dentavibe — Full-Stack Developer

Dates: February 2025 – October 2025 | **Location:** Etobicoke, Ontario, Canada (Remote)

- Delivered 10+ adaptive React.js pages with backend integration, streamlining lead workflows by 30%.
- Integrated Zoho CRM using REST APIs, automating lead capture and reducing response time by 25%.
- Built JWT-secured dashboards for Admin, Coordinator, and Dentist roles.
- Implemented AI-powered insurance and analysis features with real-time processing and automated email notifications.

5. Achievements, Certification, and Education

- **OpenAI appreciation:** Received appreciation from OpenAI's Head of Engineering for identifying a UI bug.

- **Outskill Generative AI Mastermind:** Built an AI automation agent for LinkedIn content using Gemini and DALL·E.
- **Web Development:** Resume lists a web development certification involving completed projects.
- **Education:** Bachelor of Engineering in Computer Science, JSPM's Bhivrabai Sawant Institute of Technology and Research, Pune, Maharashtra; CGPA 8.47; 2020–2023.

6. Portfolio Chatbot FAQ

What projects has Shubham built?

His portfolio project set includes a real-time chat application using microservices, InterviewIQ.ai for AI-powered mock interviews, SparkCv.ai for AI-assisted ATS-oriented resumes, CineBook for movie booking, and a RAG-powered customer-support chatbot using Gemini AI and Pinecone.

How does Shubham's RAG customer-support chatbot work?

It loads support documents, splits them into chunks, generates embeddings, stores vectors in Pinecone, retrieves relevant chunks for a user question, and uses Gemini AI to draft a context-grounded answer.

Which vector database does the support chatbot use?

The project notes identify Pinecone as the vector database. Do not describe this project as using MongoDB Vector Search unless the implementation is changed.

What technologies are used in the real-time chat app?

The resume lists Node.js, TypeScript, AWS EC2, RabbitMQ, Redis, Socket.IO, JWT, Axios, Cloudinary, Multer, and a React frontend.

What does InterviewIQ.ai do?

InterviewIQ.ai is an AI-powered mock interview platform with role-based difficulty, voice-based follow-up questions, timed interview simulation, and Razorpay payment integration. Additional flow details should be described as current only after confirming the live deployment.

What does SparkCv.ai do?

SparkCv.ai is an AI resume builder that assists with ATS-oriented resume creation, resume parsing, and AI-generated summaries and experience content. The recorded stack includes React, Node.js, Express, MongoDB, JWT, and Redux.

What does CineBook do?

CineBook is a MERN-stack movie-booking platform with Clerk authentication and RBAC, Stripe payments and webhooks, real-time seat selection, Inngest background jobs, and TMDB movie data.

What measurable results are listed in the resume?

The Dentavibe experience lists a 30% improvement in lead workflows and a 25% reduction in response time after Zoho CRM integration. The AI Resume Builder is described as having a 90%+ keyword match rate; that metric is reported in the resume and is not independently verified.

What are Shubham's main technical skills?

The resume lists JavaScript, TypeScript, React.js, Redux, Node.js, Express.js, MongoDB, Redis, AWS, REST APIs, RabbitMQ, Docker, and other tools. Refer to the Technical Skills section for the broader list.

Where can I find the project source code or live demos?

The resume indicates that Live and Code links exist, but the actual URLs were not available in the extracted resume text used to build this document. The chatbot should not invent URLs; it can direct visitors to the project links shown on the portfolio website.

7. Retrieval and Answering Rules

- Ground answers in this document and the currently indexed portfolio content.
- Do not infer that every skill was used in every project; use project-specific technology lists.
- Preserve the context of metrics: 30% lead-workflow improvement and 25% response-time reduction belong to Dentavibe; 90%+ keyword match rate belongs to the AI Resume Builder and is a reported claim.
- Do not invent URLs, customer names, user counts, benchmark results, exact deployment status, or features not stated here.

- If a visitor asks about a detail not covered in the knowledge base, say it is not specified and, where appropriate, suggest checking the portfolio project page.
- When describing the RAG architecture, distinguish the embedding model, vector database, retrieval stage, and response-generation model.

8. Missing or Unverified Details

Actual LinkedIn, GitHub, portfolio, Live, Code, certificate, and OpenAI-details URLs are not present in the extracted resume text. Project-by-project release dates, production traffic, user counts, uptime, and most performance benchmarks are also not specified. Confirm any deployment-dependent feature descriptions against the current live project before presenting them as guaranteed.
